The global Digital Aquaculture market size is predicted to grow from US$ 147 million in 2025 to US$ 397 million in 2032; it is expected to grow at a CAGR of 15.6% from 2026 to 2032.

Digital Aquaculture refers to the application of digital technologies such as IoT (Internet of Things), AI (Artificial Intelligence), cloud computing, big data analytics, and remote sensing in aquaculture to enhance productivity, sustainability, and decision-making. It enables real-time monitoring and automated control of water quality, feed management, fish health, and environmental parameters. By integrating sensors, smart devices, data platforms, and predictive models, digital aquaculture improves resource efficiency, reduces labor dependency, minimizes disease risks, and ensures traceability throughout the aquaculture value chain. It plays a vital role in modernizing fish and shrimp farming for scalable, sustainable growth.

The digital aquaculture management system integrates advanced Internet of Things, sensors and data analysis technologies to achieve real-time monitoring and refined management of the entire breeding process, greatly improving breeding efficiency and product quality, reducing resource waste and environmental impact, and providing strong technical support and innovative impetus for the sustainable development of the aquaculture industry.
