A digital carbon management platform is a comprehensive management information system that leverages digital technologies?such as the Internet of Things (IoT), big data, cloud computing, and artificial intelligence?to automate the collection, real-time monitoring, precise accounting, intelligent analysis, and visual presentation of carbon emission data across the entire lifecycle of an enterprise, industrial park, or supply chain. By integrating with various energy metering devices, production systems, and business systems, it establishes a closed-loop management process that spans the entire workflow?from carbon inventorying, carbon footprint tracking, and the setting of emission reduction targets and pathway simulations, to assisting with carbon asset trading and the automated generation of ESG reports. Ultimately, it serves as a digital decision-support tool, empowering enterprises to scientifically formulate carbon neutrality strategies, fulfill regulatory disclosure requirements, and enhance their green competitiveness.
