The global Digital Ceramic Printing Machine market size is predicted to grow from US\$ 782 million in 2025 to US\$ 1078 million in 2031; it is expected to grow at a CAGR of 5.5% from 2025 to 2031.

Inkjet printing is a digital printing technology and thus can be used to produce patterns without the need for masks and dies. The application of inkjet printing to ceramic decoration is a natural extension of its use in the conventional paper- and textile-based printing industry. However, the glazes and colors that have been developed for inkjet tile decoration using inkjet printing are likely to be very similar to those needed for ceramic additive manufacturing, at least in their physical properties. Thus the expertise originally developed for ink development in the tile printing sector will enable the development of suitable inks for ceramics additive manufacturing. In addition, because these inks are for the most part pigment particulate suspensions, there has been a need to develop printheads that are compatible with highly loaded ceramic suspensions, which will also benefit ceramics additive manufacturing.

The global ceramic 3D printing market will grow from \$2.5 billion in 2022 to \$3.55 billion in 2030, with a projected compound annual growth rate (CAGR) of 4.8% over the period. The ceramic 3D printer market is expected to significantly expand. Considering that ceramic additive manufacturing is still relatively new, the demand for ceramic additive manufacturing (AM) has increased due to the increased research and development of 3DP technologies such as FDM and inkjet printing.
