Digital Electricity Trading Platform refers to a digital market infrastructure or organized operating platform used to support electricity bidding, transaction matching, market clearing, settlement, scheduling, information disclosure, and participant management. It serves power generators, electricity retailers, utilities, energy traders, and large electricity consumers. The market includes spot electricity trading services, electricity derivatives trading services, and market operation and system administration services. It excludes the underlying value of electricity traded, ordinary power-grid transmission revenue, electricity retail revenue, standalone ETRM software, and internal trading systems without external market-operation functions.

Midstream covers platform development, market operation, transaction matching, bidding management, clearing, settlement, scheduling coordination, participant registration, data disclosure, and compliance supervision. Downstream participants include power generation companies, electric utilities, retail electricity suppliers, energy traders, large industrial consumers, energy-storage operators, renewable-energy producers, and demand-response aggregators.
