A digital imaging plate (DIP) is a flat, flat panel used in digital radiography to capture X-ray images. It consists of a sensor array that converts X-ray photons into digital signals, which are then processed to create an image. Unlike traditional film X-rays, DIPs do not require chemical processing and allow for immediate image capture and review, making them more efficient and environmentally friendly. They are used in various medical, dental, and veterinary fields for capturing X-ray images of different body parts.

The global Digital Imaging Plate market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
