A Digital Oral Impression Machine is a medical device that captures three-dimensional (3D) digital images of the intraoral structures—such as teeth, gums, and occlusion—using optical scanning technology. Replacing traditional physical impression materials like silicone, these devices typically include a handheld scanner, image processing software, and a digital display unit. Utilizing structured light, laser, or infrared technology, they generate accurate digital impressions in real time. Widely used in restorative dentistry, orthodontics, implantology, and chairside CAD/CAM workflows, digital oral impression machines offer improved accuracy, greater patient comfort, and streamlined data integration in modern dental practices.
