A digital pathology remote diagnostic platform is a system that allows pathologists to view, analyze, and diagnose digital images of tissue samples remotely, using computer software and networks. The platform includes a digital slide scanner, which scans glass

slides containing tissue samples and converts them into high-resolution digital images. These images can then be viewed, analyzed, and shared by pathologists and other medical professionals, regardless of their location.

The remote diagnostic platform typically includes a software program that allows users to annotate, measure, and mark up digital images to aid in diagnosis. It may also include artificial intelligence algorithms that can assist with image analysis and diagnosis.

Digital pathology remote diagnostic platforms are useful in situations where pathologists are not physically located near the tissue sample or where multiple pathologists need to collaborate on a diagnosis. They can also improve diagnostic accuracy and reduce turnaround times compared to traditional microscopy-based diagnoses.
