The global Digital Residual Chlorine Sensor market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A 'Digital Residual Chlorine Sensor' is a sensor device that measures and monitors the concentration of residual chlorine in a water sample using digital technology. Residual chlorine refers to the chlorine that remains in water after the disinfection process. Digital residual chlorine sensors utilize various measurement principles, including electrochemical or optical methods, to accurately detect and quantify the concentration of residual chlorine. The sensor converts the measured chlorine level into a digital signal, which can be displayed on a digital screen or transmitted to a control system for monitoring and control purposes.

Digital residual chlorine sensors provide real-time measurements, allowing for immediate adjustments or interventions if chlorine levels deviate from desired targets. Their digital nature simplifies data collection, analysis, and integration with control systems, enabling effective chlorine monitoring and control in various applications.
