The global Digital Shore Hardness Tester market size is predicted to grow from US$ 48.11 million in 2025 to US$ 69.02 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2024, global production of Digital Shore Hardness Tester reached approximately 85,000 units, with an average selling price of approximately US$550 per unit. The single-line production capacity is approximately 4,000 units per year, with an average gross profit margin of approximately 25-40%. Digital Shore Hardness Tester is a Shore hardness measuring instrument that directly displays the hardness value on a digital display. It uses a standard-shaped indenter to press into the material surface under a specified spring force. The indenter displacement is measured to calculate and directly display the hardness value. It is primarily used to measure the hardness of non-metallic materials such as rubber and plastic.

The upstream supply chain for Digital Shore Hardness Tester primarily includes suppliers of core raw materials and components, including high-precision sensors, microprocessor chips, LCD modules, specialized mechanical components (such as indenters and springs), and engineering plastics and metal casings. Downstream, these instruments are widely used by end-users such as rubber, plastic, and composite product manufacturers (such as tire, seal, and shoe material manufacturers), quality inspection agencies, and research institutes.

United States market for Digital Shore Hardness Tester is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
