Digital Signature Server, also known as signature verification server, is an entity product and a hardware device used to create, generate, manage and verify digital signatures. Digital signatures bind electronic files or data to a specific private key by using cryptographic algorithms and public key encryption to ensure data integrity, identity authentication and non-repudiation. The digital signature server provides a secure key management system that can generate digital certificates, store and manage public and private keys, and perform digital signature and verification operations. It is usually used in scenarios that require data authentication, data integrity and non-repudiation, such as electronic contract signing, electronic file transmission, digital certificate issuance, etc. Digital signature servers provide a reliable way to protect and verify the authenticity and credibility of electronic documents, not only helping users meet compliance requirements, but also providing important guarantees to ensure the security and reliability of electronic transactions.
