Digital smart waste management refers to any system that uses technology to make trash collection more efficient, cost-effective and environmentally friendly. Most of these systems are equipped with the Internet of Things (IoT), a monitoring technology that collects and tracks real-time data, which gives municipalities, cities and waste collectors the ability to optimize their waste operations, become more sustainable, and make smarter business decisions.

Smart waste management focuses on solving the previously mentioned solid waste management problems using sensors, intelligent monitoring systems, and mobile applications. The first smart waste management solution to make the waste collection process more efficient is sensors. Sensors can measure the fill level of the containers and provide updated information at any time and notify waste management services to empty them when they are full or almost full. These devices help optimize the best possible route containing fully filled containers and create smart schedules for drivers. The selection of the containers also minimizes the need for trash collection staff because their duties are deduced. They can also alert the waste management companies or municipalities if an undesirable incident happens such as sudden temperature rise or displacement of the container by their GPS features.

IoT solutions for solid waste management problems offer municipalities data intelligence and real-time insights. In that regard, the fill patterns of specific containers can be identified by historical data and managed accordingly in the long term. In addition to hardware solutions, mobile applications are used to overcome the challenges in the

regular waste management system, such as keeping track of the drivers while they are operating on the field.

The global Digital Smart Waste Management Sensors and Software market size is projected to grow from US\$ 558 million in 2024 to US\$ 1579 million in 2030; it is expected to grow at a CAGR of 18.9% from 2024 to 2030.
