The global Digital Solutions for Waste Management market size is predicted to grow from US$ 531 million in 2025 to US$ 840 million in 2032; it is expected to grow at a CAGR of 7.0% from 2026 to 2032.

Digital Solutions for Waste Management refers to the systematic restructuring and intelligent upgrading of the entire waste management chain, from generation and sorting to collection, transportation, treatment, and resource utilization, utilizing cutting-edge technologies such as the Internet of Things, big data, artificial intelligence, and geographic information systems. This solution achieves automatic early warning of waste overflow, dynamic optimization of collection routes, and real-time visibility of the treatment process by deploying smart sensors at waste collection points, installing vehicle positioning and video surveillance on collection vehicles, and establishing a digital transfer and dispatch platform. Its core lies in breaking down information silos from waste generation to final disposal, using data to drive precise resource allocation and improve operational efficiency, thereby reducing collection costs, increasing resource recovery rates, and achieving digital monitoring of carbon emissions and environmental compliance.

Digital Solutions for Waste Management are undergoing a transformation from a labor-intensive approach to data-driven, refined governance. Technologically, the Internet of Things (IoT) enables end-to-end data collection through abundant sensors, vehicle-mounted smart terminals, and electronic manifests; 5G and narrowband IoT support massive numbers of devices online in real time; AI-powered visual recognition is gradually replacing manual methods for assessing waste sorting quality; and Geographic Information Systems (GIS) and route optimization algorithms are improving collection and dispatch efficiency. In terms of development trends, the industry is

evolving from single-stage monitoring to full lifecycle traceability of solid waste, with a particular emphasis on closed-loop management of medical and hazardous waste, and is beginning to explore the integration of a zero-waste city data foundation with carbon emission reduction accounting. Key drivers of development include policy requirements for resource recycling under dual-carbon goals, the demand for refined measurement resulting from mandatory waste sorting, and the intrinsic motivation of sanitation companies to reduce costs and increase efficiency. However, its development still faces significant obstacles: high costs for intelligent transformation of front-end sorting facilities, low accuracy rates in resident sorting leading to data distortion; multiple business entities involved in the collection and transportation process, resulting in inconsistent data standards and information silos; furthermore, the outdoor durability of smart devices, data transmission stability, and how to balance public privacy with regulatory needs are also pressing issues that need to be addressed.
