Digital Twins in Maritime Operations is a digital mirroring technology for ships and maritime assets. It achieves real-time mapping and two-way interaction between the real and digital worlds by constructing digital models in virtual space that perfectly correspond to the physical entities. The system integrates IoT sensors, satellite communication, big data analytics, and simulation algorithms to perform high-fidelity simulations and extrapolations of factors such as ship navigation status, equipment health, marine environment, and port operations. It not only monitors current operational status in real time but also predicts future trends based on historical data, conducts emergency drills or operational strategy tests in the virtual environment, and feeds back the optimization results to the physical entities. This technology is widely used in intelligent ship navigation, port scheduling optimization, and fleet energy efficiency management, aiming to improve shipping safety, operational efficiency, and the scientific nature of decision-making.
