The global Digital Ward Solutions market size is predicted to grow from US\$ 3698 million in 2025 to US\$ 7564 million in 2032; it is expected to grow at a CAGR of 10.9% from 2026 to 2032.

The digital ward solution integrates advanced technologies such as the Internet of Things, artificial intelligence, and big data to achieve intelligent management of ward environment, medical equipment, patient information, and nursing processes, improve medical efficiency and nursing quality, optimize patient experience, assist doctors in decision-making, and build an efficient, safe, and convenient smart medical system.

The growth of the digital ward solution market is primarily driven by factors such as hospital IT upgrades, the digitization of nursing workflows, a growing need for patient safety management, strained medical staffing resources, and a demand for refined hospital operations. As inpatient wards transition from traditional models characterized by paper records, manual rounds, and decentralized equipment management to digital management models centered on electronic medical records (EMR), mobile nursing, bedside terminals, nurse call systems, vital sign monitoring, infusion monitoring, electronic bedside cards, ward dashboards, and clinical communication systems, hospitals can achieve real-time integration of processes including order execution, patient identification, nursing documentation, bed status tracking, patient risk assessment, and equipment data management. Digital ward solutions help reduce manual documentation errors, enhance nursing efficiency, mitigate risks such as falls, pressure ulcers, infusion irregularities, and medication administration errors, while also improving patient communication and the overall inpatient experience. Meanwhile, factors such as an aging population, a rising number of patients with chronic diseases, increased pressure on bed turnover, and the ongoing development of 'smart hospitals'

are prompting healthcare institutions to accelerate the digital transformation of their wards. Looking ahead, as technologies such as the Internet of Medical Things (IoMT), 5G/Wi-Fi 6, wearable monitoring, and AI-driven early warning systems mature alongside improved integration capabilities with hospital information systems, digital ward solutions will evolve from basic IT tools into comprehensive platforms that encompass closed-loop nursing, patient safety, clinical collaboration, and ward operational management.
