The single-line production capacity is approximately 3,700 units per year, with an average gross profit margin of approximately 20-35%. Digital Whiteness Meteris a digital display instrument that measures the whiteness of an object's surface. It uses an optical sensor to measure the brightness of reflected light from the surface and displays the whiteness value digitally. These instruments are widely used in industries such as papermaking, textiles, plastics, ceramics, and chemical and building materials for material quality control and product inspection to ensure that whiteness meets standard requirements.

The upstream supply chain primarily includes core raw materials and components, such as silicon photoelectric sensors, LED or halogen lamp light sources, integrating spheres, optical filters, microprocessor chips, and other electronic and optical components, as well as standard white board blanks for calibration. The downstream supply chain encompasses a wide range of application industries, including high-end printing and office paper in the papermaking industry, ceramic tiles and coatings in the building materials industry, plastics and textiles in the chemical industry, and flour and starch in the food industry. The quality control of these finished products relies on whiteness meter measurements.

United States market for Digital Whiteness Meter is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
