The global Dilauroyl Peroxide market size is predicted to grow from US$ 135 million in 2025 to US$ 179 million in 2032; it is expected to grow at a CAGR of 4.2% from 2026 to 2032.

Dilauroyl peroxide is a white crystalline powder organic compound belonging to the class of organic peroxide initiators. It is primarily used as a free-radical polymerization initiator in the production of resins such as vinyl chloride and styrene. It can also be used as a plastic crosslinking agent, rubber curing agent, and oil bleaching agent.

The core upstream raw material is lauric acid (dodecanoic acid), obtained by fractional distillation of coconut oil or palm kernel oil. This is then converted into lauroyl chloride through reaction with thionyl chloride or phosphorus trichloride, and finally condensed with hydrogen peroxide under alkaline conditions.

Global sales in 2025 are projected to be approximately 8,000 tons, with an average market price of approximately US$17,210 per ton. The industry's gross profit margin is in the range of 15%–25%.

Dilauroyl peroxide is an indispensable free-radical initiator in the production of polyvinyl chloride (PVC) and specialty resins. Its future growth potential lies primarily in the development of high-performance polymers and environmentally friendly bio-based plastics. The sustained global demand for high-end PVC pipes and profiles in infrastructure construction, as well as the increasing performance requirements for unsaturated polyesters and composite materials in new energy vehicles and wind power applications, provide robust market drivers for dilauroyl peroxide.
