The global Dimethylamine Anhydrous (DMA) market size is predicted to grow from US\$ 203 million in 2025 to US\$ 272 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Dimethylamine Anhydrous (DMA) refers to dimethylamine products with extremely low or almost no water content, and is an important organic amine based chemical raw material. This substance is usually stored and transported in gas or liquefied form, with strong alkalinity and reactivity, and can participate in various organic synthesis reactions. Industrial production generally involves the reaction of methanol and ammonia under the action of a catalyst to produce a mixture of methylamine, which is then separated and distilled to obtain high-purity anhydrous dimethylamine. It is widely used in pesticide intermediates, pharmaceutical intermediates, rubber additives, solvents, surfactants, and fine chemical manufacturing, and is one of the important products in the methylamine industry chain. In 2025, global Dimethylamine Anhydrous (DMA) production reached approximately 284 K MT, with an average global market price of around US\$ 731 per ton.

The annual production capacity of dimethylamine anhydrous is 400 thousand tons, with a gross profit margin of about 25%.

Upstream: The main raw materials for anhydrous dimethylamine are methanol and ammonia.

Downstream: Mainly used as rubber vulcanizing accelerator, leather depilation agent, textile industry solvent, rocket propellant, and others.

Raw material costs account for approximately 65% to 75%, energy and utility costs account for approximately 10% to 15%, manufacturing and equipment depreciation costs account for approximately 5% to 10%, and logistics and storage costs account for approximately 5% to 8%.

United States market for Dimethylamine Anhydrous (DMA) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
