DIP Crystal Oscillator is an electronic component that uses the characteristics of crystals to generate stable frequency signals. DIP stands for Dual In-line Package, which refers to the packaging type of the crystal resonator, which is usually connected to the circuit board in a plug-in manner. The working principle of a crystal resonator is based on the piezoelectric effect of the crystal. When an electric field is applied, the crystal vibrates mechanically and vice versa. The frequency of this vibration is determined by the physical properties of the crystal, making it very stable. The crystal resonator converts the frequency of crystal vibration into an electrical signal output. The frequency of this output signal is usually very precise and is suitable for applications that require high-precision clock signals, such as communication equipment, computer systems, measurement equipment, etc.

The global DIP Crystal Oscillator market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
