Dipeptide Peptidase 4 (DPP-4) Inhibitors are a class of oral diabetes drugs that work by blocking the action of DPP-4, an enzyme which destroys a group of gastrointestinal hormones called incretins. Incretins help stimulate the production of insulin when it is needed (e.g. after eating) and reduce the production of glucagon by the liver when it is not needed (e.g. during digestion). They also slow down digestion and decrease appetite. So by protecting incretins from damage, DPP-4 inhibitors help regulate blood glucose levels.

The global Dipeptide Peptidase 4 (DPP-4) Inhibitors market size is projected to grow from US\$ 8788.8 million in 2023 to US\$ 10370 million in 2030; it is expected to grow at a CAGR of 2.4% from 2024 to 2030.
