The global Diphenyl Oxide market size is predicted to grow from US\$ 124 million in 2025 to US\$ 165 million in 2032; it is expected to grow at a CAGR of 4.2% from 2026 to 2032.

Diphenyl oxide, also known as DPO or diphenyl ether, is a colorless crystalline or liquid substance with a light, geranium-like aroma. As an important organic intermediate and industrial raw material, it is known for its chemical stability and low price, and is commonly used in heat transfer media, synthetic fragrances, and flame retardant production.

The upstream industry mainly relies on basic organic chemicals, with phenol as the core raw material. Production processes primarily include phenol dehydration and the condensation of chlorobenzene with sodium phenolate. This stage is significantly affected by fluctuations in crude oil prices and phenol production capacity cycles.

Global sales in 2025 were approximately 50,000 tons, with an average selling price of US\$2,534 per ton. The industry's gross profit margin is between 20% and 30%.

New growth drivers in the industry stem from the continued boom in renewable energy storage and high-end electronics manufacturing. On the energy side, concentrated solar power (CSP), as one of the best pathways for long-term energy storage, is driving increased demand for biphenyl-diphenyl ether (BPE) azeotropic heat transfer oil, a medium with excellent thermal stability. Particularly in high-end applications such as semiconductor packaging materials and 5G communication devices, BPE has become a key raw material due to its superior performance and environmentally friendly characteristics. It is important to note the high volatility of upstream raw material phenol prices. Because the production cost of BPE is highly coupled with the petrochemical industry chain, fluctuations in global energy prices directly compress the profit margins

of midstream companies.
