## Abstracts

The global Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine market size is predicted to grow from US\$ 4310 million in 2025 to US\$ 4930 million in 2032; it is expected to grow at a CAGR of 1.9% from 2026 to 2032.

Adsorbed acellular pertussis-diphtheria-tetanus combined vaccine refers to a combined vaccine formulation that uses acellular pertussis antigen (such as pertussis toxin PT, filamentous hemagglutinin FHA, etc.) to replace the traditional whole-cell components, and is combined with diphtheria toxoid and tetanus toxoid. The antigen is adsorbed onto an aluminum salt adjuvant (such as aluminum hydroxide or aluminum phosphate). The acellular technology reduces the incidence of adverse reactions, and the adjuvant enhances the immune response and antibody persistence. This vaccine is mainly used to prevent pertussis, diphtheria, and tetanus, and is the mainstream product in the childhood immunization programs of most countries. It can also be combined with antigens for polio, Hib, hepatitis B, etc., to form multivalent vaccines for basic immunization and booster immunization programs in infants and young children. The global annual demand is estimated at 180-240 million doses in 2025.

Adsorbed acellular pertussis-diphtheria-tetanus combined vaccine (DPT vaccine) is a combination vaccine product that uses acellular pertussis antigen to replace the traditional whole-cell component and combines it with diphtheria toxoid and tetanus toxoid. It also utilizes aluminum salt adjuvants to enhance the immune response. This vaccine significantly reduces the incidence of adverse reactions while ensuring immunization efficacy and has become a mainstream product in the childhood immunization programs of most developed countries worldwide. With the accelerated trend of upgrading multivalent vaccines, the strategic position of adsorbed acellular DPT vaccine in the global vaccine market continues to rise.

In recent years, the global vaccine industry has gradually shifted from a phase of 'coverage improvement' to one of 'structural upgrading and value enhancement.' Adsorbed acellular DPT vaccine, as a high-safety, high-tech barrier product, occupies a dominant position in the revenue structure. Developed countries have fully adopted the acellular technology route and optimized immunization programs through quadrivalent, pentavalent, and hexavalent vaccine products, improving vaccination convenience and compliance. Emerging markets are also gradually increasing the penetration rate of acellular products as regulatory standards and public health systems improve.

From a product structure perspective, the trivalent acellular DPT vaccine remains the basic form, but multivalent products are showing more significant growth. Quadrivalent (DTaP+IPV), pentavalent, and hexavalent vaccines offer significant advantages in reducing the number of vaccinations and optimizing childhood immunization pathways, driving up the value of single-dose vaccines and expanding the market size. Furthermore, the demand for reduced-dose booster vaccines (Tdap) for adolescents and adults continues to grow, expanding the applicable population and creating structural growth potential for the market.

In terms of industry structure, the global market for adsorbed acellular DTaP-PT combined vaccines is highly concentrated, with large international vaccine companies possessing leading advantages in antigen purification technology, multivalent formulation development, and quality control systems. Some regional companies have cost and channel advantages in their local markets, but the overall industry entry barriers are high. With increasingly stringent regulations and continuously improving quality standards, production consistency, cold chain management capabilities, and R&D innovation capabilities have become core competitive factors for companies.

Regional market structure: North America and Europe are dominated by high-end multivalent acellular vaccines, with higher single-dose prices; the Asia-Pacific region holds a significant market share due to its large population and increased efforts in immunization program implementation; Latin America and some emerging markets are in the process of upgrading from whole-cell to acellular vaccines, presenting significant potential for structural upgrading. Overall, the global market is experiencing steady growth, with the trends of multivalent and premium vaccines continuing to drive industry expansion.

Looking ahead, the adsorbed acellular pertussis-diphtheria-tetanus combined vaccine market will be driven by three core factors: first, the continued advancement and

increased coverage of childhood immunization programs; second, the increased value per dose due to higher penetration rates of multivalent vaccines; and third, the expansion of booster immunization to a wider age range. Market growth will primarily stem from product structure upgrades and increased technological barriers.
