Dipotassium glycyrrhizate is the dipotassium salt of glycyrrhizic acid, also known as glycyrrhizin, which is a key component in licorice root extract. Licorice is the root of the *Glycyrrhiza glabra* plant, an herbaceous perennial legume native to southern Europe and parts of Asia, such as India.

Dipotassium glycyrrhizate is a skin-conditioning agent that has the ability to improve the appearance of dry or damaged skin by reducing flaking and restoring suppleness. It has a soothing effect and also calms inflammation. In fact, clinical studies have determined that dipotassium glycyrrhizate is an effective treatment for atopic dermatitis (eczema) because of its ability to reduce redness and irritation.

Dipotassium glycyrrhizate has also been shown to help preserve hyaluronic acid content in the skin. Hyaluronic acid is a key molecule involved in maintaining skin hydration with the ability to hold up to 1,000 times its weight in water. Youthful skin retains its turgor, resilience, and pliability due to its rich supply of hyaluronic acid and high water content. By preserving hyaluronic acid content in the skin, dipotassium glycyrrhizate helps to maintain hydrated, youthful skin.

Lastly, dipotassium glycyrrhizate functions as an emulsifier and gel-forming agent in cosmetics and personal care products. Emulsifiers are necessary for products that contain both water and oil components. Mixing water and oil together creates a dispersion of oil droplets in water (and vice versa). However, these two phases can separate if the product is left to settle. To address this problem, an emulsifier can be added to the system to help the droplets remain dispersed. Emulsifiers improve the

consistency of a product, which enables an even distribution of topical skin care benefits.
