The global Dipropylene Glycol Diacrylate (DPGDA) market size is predicted to grow from US\$ 627 million in 2025 to US\$ 841 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Dipropylene glycol diacrylate (DPGDA) is a bifunctional reactive acrylate monomer. It exhibits moderate viscosity, low volatility, and high reactivity, rapidly polymerizing to form a cross-linked structure under ultraviolet (UV) or electron beam (EB) irradiation.

This product is prepared by the esterification reaction of dipropylene glycol and acrylic acid. DPGDA combines good dilution properties with film hardness, significantly improving the flowability and surface gloss of formulations. It is one of the commonly used reactive diluents in UV-curable coatings, inks, adhesives, and photosensitive resins. Global sales volume in 2024 was approximately 280,000 tons, with an average market price of approximately US\$2,200 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, typically ranging from 10,000 to 30,000 tons per year, with industry gross profit margins ranging from 10% to 25%.

Dipropylene glycol diacrylate (DPGDA), as one of the most widely used medium-viscosity bifunctional acrylate monomers in UV curing technology, is experiencing continuous growth and structural upgrades. With increasingly stringent global environmental regulations and the widespread adoption of green manufacturing concepts, UV/EB curing technology, with its advantages of "zero VOC emissions, high solids content, and rapid curing," is rapidly replacing traditional solvent-based systems, leading to a steady increase in demand for DPGDA. Especially in high-value-added fields such as UV inks, wood coatings, electronic adhesives, and 3D printing

photosensitive resins, DPGDA, with its excellent flowability, reactivity, and film-forming balance, has become one of the industry's preferred basic monomers.
