Direct Chip Cooling Cold Plate for Server are specialized heat management components designed to transfer heat away from high-performance electronic devices or systems by directly cooling them with a liquid coolant. Unlike traditional air-based cooling systems, which rely on air flow to dissipate heat, DLC cold plates use a liquid coolant (such as water or a water-glycol mixture) that circulates through the cold plate to absorb and carry away heat.

The cold plate is typically in direct contact with the heat-generating components (e.g., processors, power transistors, or GPUs), and the liquid coolant flows through internal channels or microchannels in the plate. As the coolant passes over these hot surfaces, it absorbs the heat, thus preventing overheating and maintaining optimal operating temperatures for electronic components.
