The global Direct Lithium Extraction System market size is predicted to grow from US\$ 1318 million in 2025 to US\$ 1979 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Direct Lithium Extraction System is an integrated extraction system designed for liquid lithium resources such as salar brine, geothermal brine, oilfield produced water, industrial lithium-bearing water, and battery recycling streams. It usually consists of units such as brine pretreatment, selective lithium extraction, elution and regeneration, concentration and purification, impurity control, lithium precipitation, or precursor solution preparation. The system selectively enriches low-concentration lithium ions from high-salinity, high-magnesium, high-calcium, or complex impurity-containing streams through adsorption separation, ion exchange, membrane separation, solvent extraction, electrochemical separation, or combined processes, and converts them into lithium chloride concentrate, lithium carbonate products, or lithium hydroxide precursor solutions. Compared with conventional solar evaporation, Direct Lithium Extraction System places greater emphasis on shorter process flows, higher recovery rates, smaller land footprint, lower water disturbance, and stronger resource adaptability, thereby improving the development value of low-grade brines, complex brines, and unconventional lithium-bearing waters. Its main customers include lithium resource developers, salar operators, geothermal energy companies, oilfield operators, lithium salt producers, and new energy material companies.

English Viewpoints: The industrial value of Direct Lithium Extraction Systems is shifting from a single technology substitute to a restructuring of lithium resource development. Conventional solar evaporation depends on long natural concentration cycles and is highly sensitive to climate, land, water availability and brine composition, making it

difficult to fully unlock the economic potential of high-magnesium, low-grade and complex brines. Direct Lithium Extraction Systems capture lithium ions earlier from complex saline streams through selective separation units and then connect them with downstream concentration, impurity removal and lithium salt production processes. As a result, resource evaluation, project construction and capacity ramp-up are moving from resource-endowment-driven logic toward process-adaptation-driven logic. As electric vehicles, energy storage batteries and cathode material industries require more stable lithium supply, these systems are not only used for new salar projects, but also for upgrading existing salar operations, commercializing low-grade brines, co-producing lithium from geothermal resources and recovering lithium from oilfield produced water. Future competition will focus on recovery rate, selectivity, reagent and material life, continuous operating stability, energy consumption per unit of lithium product and integration with downstream lithium salt production lines. The growth momentum of Direct Lithium Extraction Systems comes from three major forces: lithium supply chain localization, unconventional resource development and environmentally oriented mining investment. North America, South America, Europe and China are all promoting critical mineral supply security, making salar brines, geothermal brines and oilfield brines important targets for the next phase of lithium resource expansion. Compared with hard-rock lithium mining, brine resources are better suited to integration with water treatment, oil and gas engineering, geothermal development and chemical separation capabilities, attracting energy companies, engineering firms, materials suppliers and lithium salt producers into the market. System formats are also moving from laboratory validation toward skid-mounted, modular and fixed commercial plants. Pilot systems are used to rapidly verify brine compatibility, modular units help reduce on-site construction cycles, and fixed plants support stable large-scale supply. As more projects move into industrial operation or commercial design, market evaluation will gradually shift from proof of concept to actual output, product quality, operating cost and long-term reliability. Suppliers with strong engineering delivery capability and material regeneration capability will be better positioned to win project orders. From the downstream demand perspective, the strategic importance of Direct Lithium Extraction Systems lies not only in increasing lithium output, but also in improving the flexibility of lithium resource supply. The power battery and energy storage battery industries require stable quality for lithium carbonate, lithium hydroxide and lithium chloride intermediates, so Direct Lithium Extraction Systems must be integrated with boron removal, magnesium removal, calcium removal, concentration, lithium precipitation and crystallization processes to produce saleable battery-grade or near-battery-grade products. A more optimistic development path is that mature salar regions use these systems to improve recovery rates and shorten construction cycles, unconventional brine regions use them to open new resource pathways, and traditional lithium salt plants use them to upgrade

front-end feedstock structures. If the systems continue to prove their advantages in cost, land footprint and continuous operation, their business models will expand from equipment sales to process package licensing, core material supply, module leasing, engineering procurement and construction, and operation-based revenue sharing, while the industry space will continue to grow as the development boundary of lithium resources expands.
