Directed Energy Deposition (Directed Energy Deposition) 3D printer is a 3D printing technology that uses high-energy sources such as lasers or electron beams to melt and solidify materials layer by layer to manufacture three-dimensional objects. In directed energy deposition 3D printing, a high-energy source, such as a laser beam, is focused on a specific location on the surface of a material, melting the material in powder or filament form and bonding it to the printed layer after solidification. This process is repeated, layer by layer, to form the desired object. Directed energy deposition 3D printers have a wide range of applications in aerospace, automotive, medical, industrial manufacturing and other fields. It can realize the manufacture of complex structures, material repair and processing, and customized production, providing innovative solutions for many industries.
