Directional Deep Brain Stimulation (dDBS) is a neuromodulatory treatment technology that uses stereotactic surgery to implant specially designed electrodes into deep neural nuclei or other neural tissues in the brain, and based on the special design of the electrodes, releases electrical stimulation in a more precise direction. The system usually has multiple segmented contacts that can be used independently or in combination to form an asymmetric activation area, achieve precise control of the direction of the current, avoid brain nuclei that do not need stimulation, and minimize side effects while maximizing the treatment effect.
