The directivity of the microphone is a description of the sensitivity mode of the microphone to the sound from all directions in space, and it is an important attribute of the microphone. In many cases, the first consideration in the selection of a microphone is its directivity, followed by other attributes of the microphone. Except for omnidirectional microphones, all other directivities are based on multi-diaphragm technology. By changing the cavity setting of the microphone head and mixing and modulating the sound signal received by the multi-diaphragm, the microphone can obtain the sensitivity of the sound in different directions. Most mics are unidirectional, but some can switch their directional.
