Disc centrifugal filter is a device that separates solids from liquids through centrifugal force. Its working principle is to use high-speed rotating disc filter elements to remove solid particles from liquids through centrifugal force. The filter is composed of multiple superimposed filter discs. When the liquid enters from the central feed port and flows through the gaps between the discs, the solid particles are captured and thrown to the collection area outside, while the clean liquid flows out through the pores of the filter screen or disc. Disc centrifugal filters are commonly used in chemical, pharmaceutical, food, environmental protection and other industries, and are suitable for treating high-concentration, difficult-to-filter suspensions and slurries.

United States market for Disc Centrifugal Filter is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
