## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Bulky materials entering into the cylinder from the hopper accumulate by itself weight on the disk. The natural angle of material is controlled on the disk by adjusting the gap between the sleeve and disc. When the disk rotates, the materials are scraped into accepted hopper by unloading knife, so with the continuous rotation of the disk, the materials are fed evenly. Adjust the gap between the unloading knife and the disk to control the feeding volume.
