The dry fog dust suppression system at the discharge port is a technical system used to control and reduce dust diffusion during the material discharge process. The system sprays fine water mist or dry fog particles into the air to moisten and settle suspended dust particles, thereby effectively suppressing dust diffusion and pollution. This system is particularly suitable for scenes where a large amount of dust is generated due to drop, impact, etc. during material discharge, such as the discharge port of bulk material transfer sites such as mines, coal yards, and port terminals.

The global Discharge Port Dry Fog Dust Suppression System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
