A dishwasher water pump is the core cleaning component inside the dishwasher, essentially its 'heart.' Its main function is to draw water from the tank, pressurize it, and spray it through the spray arms, creating a high-pressure water jet to rinse the dishes. It mainly consists of a circulation pump (responsible for high-pressure spraying) and a drain pump (responsible for separating wastewater), ensuring a continuous water flow covering the dishes and quickly draining the wastewater.

In 2025, global dishwasher water pump production reached 61.42 million units, with an average selling price of \$5.34 per unit. Total production capacity was approximately 90 million units, and the industry's gross profit margin was approximately 30%-50%. Cost structure: direct materials account for approximately 65%, manufacturing costs account for approximately 25%, and labor costs account for approximately 10%. Supply chain: upstream suppliers include engineering plastics, metal materials, magnetic materials, sealing materials, and electronic control components; downstream manufacturers are dishwasher manufacturers.
