Display Mask can be divided into Photomask and Shadow Mask.

Photomasks are high-purity quartz or glass plates that contain a pattern of ICs. These are used in the reproduction of pattern structures for manufacturing printed circuit boards, electronic circuits, and LCD displays, and for the serial production of reticles and other microstructures.

Photomasks are used at wavelengths of 365 nm, 248 nm, and 193 nm. ICs are manufactured layer by layer, where each layer requires a unique photomask. As current generation ICs typically have 25-60 layers, the manufacturing process of photomasks has become complex.

Shadow Mask is the one of most important factors for patterning AMOLED pixels, and it is getting more important as the panel resolution & fab generation rises. Panel makers usually have a main supplier of fine metal mask, and they are also evaluating the second supplier's for increasing PPI.
