The global Display Resist market size is predicted to grow from US\$ 2189 million in 2025 to US\$ 3164 million in 2031; it is expected to grow at a CAGR of 6.3% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Resist is a photosensitive mixed liquid that transfers the required fine patterns from the photomask (mask) to the substrate to be processed through photolithography processes such as exposure and development through photochemical reactions. Corrosion inhibitors are widely used in semiconductor, display panel, PCB (printed circuit board) and other fields. In display panel manufacturing, resist is used to define and transfer fine patterns onto the substrate. In the field of flat panel displays, the types of photoresist include g and i-line photoresist, but the specific types are more abundant, such as color photoresist and black photolithography for color films, photoresist and touch screen photoresist used in thin film transistor processes, etc.

In 2023, China's LCD display panels account for 73% of global production. TFT-LCD is the main and largest product in the LCD display industry. As the global display panel industry continues to transfer to mainland China, the panel production capacity in mainland China has increased year by year, and the demand for domestic substitution of upstream raw materials is also continuing to increase. In 2023, there are 47 LCD production lines that have been put into production and planned to be built in mainland China, of which 8.5 generations and above account for more than 50%. The new production lines are basically mainly higher generation lines such as 8.5/8.6/10.5/11 generations. TFT-LCD is constantly upgraded, and the need for CF technology improvements has followed, such as increasing color filter transmission, which helps

increase brightness and reduces the number of backlights to reduce power consumption and cost savings.
