Abstracts

The global Disposable Endoscope Cleaning Brush market size is predicted to grow from US\$ 299 million in 2025 to US\$ 636 million in 2032; it is expected to grow at a CAGR of 11.6% from 2026 to 2032.

Disposable endoscope cleaning brush is a medical device specially used for cleaning endoscopes. It is widely used in medical institutions to improve the cleaning effect of endoscopes, reduce the risk of cross infection, and ensure the safety of patients and medical staff.

Medical institutions around the world follow increasingly stringent infection control standards (such as WHO guidelines, FDA/CE certification). Traditional reusable cleaning brushes have the risk of cross infection, and disposable products can completely avoid this problem. Endoscope-related infection incidents (such as the spread of drug-resistant bacteria) have prompted hospitals to give priority to disposable sterile consumables to reduce legal and reputation risks.

The disinfection, testing, storage and management costs of reusable brushes are high, and disposable products can simplify the process and reduce overall costs. No complex disinfection equipment is required, which is suitable for small and medium-sized medical institutions, especially in areas with limited resources.

New plastics (such as medical-grade PEEK) and antibacterial coatings improve the cleaning effect and safety of brushes. Miniaturized and flexible designs adapted to complex endoscope lumens improve surgical efficiency. The increase in minimally invasive surgeries (such as gastroenteroscopy and bronchoscopy) has driven the demand for consumables. Patients are more inclined to choose medical services

labeled "disposable sterile".
