One-time use portable electronically controlled insulin injection device capable of injecting insulin into human body regularly and quantitatively

Insulin pumps are generally considered durable devices that are designed for long-term use. They consist of a pump that delivers insulin continuously through a catheter inserted under the skin. These traditional insulin pumps require regular maintenance, such as refilling insulin cartridges and cleaning.

Disposable insulin pumps, if available in the market, would offer a different approach. They would likely be designed for single-use and then discarded after a certain period, eliminating the need for maintenance, refilling, and cleaning. This disposable nature

could offer convenience, ease of use, and reduced infection risk associated with the repeated use of traditional pumps.

The market potential for disposable insulin pumps would depend on factors such as their effectiveness, cost, and acceptance among healthcare professionals and individuals with diabetes. The adoption of disposable insulin pumps may be influenced by factors such as patient preferences, healthcare provider recommendations, and reimbursement policies.
