A disposable nasogastric feeding tube is a medical device designed to temporarily replace the patient's normal oral feeding route, inserted through the nasal cavity, directly into the stomach or small intestine. It is mainly used to provide nutritional support to patients who cannot eat orally, including those with dysphagia, coma, bowel rest after surgery, or specific digestive system diseases. This tube is usually made of soft, degradable or non-irritating mucosal materials to ensure comfort and safety during short-term use in the body. The installation process requires medical professionals to operate, and depending on the patient's needs, it can be a simple feeding tube (only used for infusion of nutrient solution) or a type with suction function to remove gastric juice or air and reduce gastric bloating.
