Disposable surface electrodes for physical therapy are single-use patch electrodes typically composed of a conductive material, a hydrogel layer, and a backing layer. They are attached to specific areas of the skin via the conductive gel surface and connected to a low- and medium-frequency therapeutic device via a wire, forming a complete circuit to achieve electrical stimulation therapy.

Upstream raw materials primarily include conductive materials (such as hydrogels, silicones, carbon fibers, and metal foils), medical substrates, adhesives, and electronic components. Midstream involves the research and development and production of electrode sheets, including product design, formulation development (such as hydrogels containing traditional Chinese medicine), large-scale production, and quality control (which must comply with medical device standards). Downstream applications primarily include medical institutions (hospital rehabilitation departments, physical therapy clinics, community health service centers, etc.) and individual home users.
