Dissector Sponge refers to a type of medical sponge specifically designed for use in surgical dissection, particularly in neurosurgery. It is a sterile, absorbent material that is used to absorb blood, tissue fluid, or other bodily fluids during surgery to help maintain a clear surgical field.

Dissector sponges are often made from soft, highly absorbent materials such as medical-grade cotton or synthetic fibers. They may also be impregnated with radiopaque substances, such as barium sulfate, to make them visible on X-ray or other imaging techniques, which allows surgeons to ensure that all sponges are removed after surgery.

The use of dissector sponges in surgery helps to reduce the risk of contamination and infection by soaking up blood and other fluids that could potentially harbor bacteria or other pathogens. They are also used to protect delicate tissues and organs from direct contact with surgical instruments, reducing the risk of damage or trauma.

Dissector sponges are disposable medical devices that should be used once and then discarded properly after surgery. They should never be reused as this can increase the risk of infection and other complications.

The global Dissector Sponge market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
