Dissolvable metallic frac balls are a key isolation tool used in multi-stage hydraulic fracturing operations in oil and gas wells. They are usually made of aluminum alloy, magnesium alloy or high-strength steel materials and have good mechanical strength and high-pressure resistance. They are pumped to a specific location downhole during the fracturing process, and work with the matching seat seal assembly to achieve segmented isolation and pressure guidance, allowing the fracturing fluid to accurately enter the target layer, thereby improving the efficiency of fracture extension and oil and gas production capacity. Metal frac balls are suitable for high-temperature and high-pressure well conditions, especially in scenarios where the degradation time requirement is not high or controllable residue is required. Although degradable composite balls have gradually become popular in recent years, metal frac balls still maintain their application advantages in some deep wells, complex formations or early completion plans due to their high strength and good dimensional stability.
