Buoyancy is an upward thrust exerted by fluid opposing the weight of the immersed object. This upward thrust is equal to the weight of the water displaced by the immersed object. Buoyancy products are objects fabricated to apply these solutions. Distributed buoyancy modules are clamped to umbilical, risers, or pipelines to hold them in specific geometric configurations with an aim to prevent overutilization of the system. The modules are attached to the equipment through clamps, which makes them easy and quick to install. They are widely used in SURF application in offshore oil & gas production and offshore wind farm cables.
