The global Distributed Servo Drives market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Distributed servo drives are servo drive systems where the drive units are distributed near the individual motors. They offer flexibility, scalability, reduced wiring complexity, improved performance, modularity, and energy efficiency. These features make them well-suited for applications that demand precise motion control and coordination of multiple drive axes.

Distributed servo drives, also known as decentralized servo drives or distributed motion control systems, are a type of servo drive architecture where the drive units are distributed or located in close proximity to the individual motors they control. Unlike centralized servo drive systems where a single control unit drives multiple motors, distributed servo drives distribute the control and power electronics to the individual motors or drive axes.
