The global Distribution Automation Terminals (DTU and FTU) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Distribution Automation Terminals are an important part of distribution automation systems to deliver real-time monitoring, fault detection, fault location, isolation and power restoration in non-fault areas on multi-line systems. These terminals include distribution terminal units (DTU), feeder terminal units (FTU) and transformer terminal units (TTU). This report only focuses on DTU and FTU products.

DTU is a terminal device of a switching station, generally installed in conventional switching station, outdoor small switching station, ring network cabinet, small substation, box-type substation, etc. It completes the acquisition and calculation of position signal, voltage, current, active power, reactive power, power factor, electric energy and other data of a switching station, performs the switching and closing operation of switches, realizes feeder switch's fault identification, isolation, and recovery power supply of non-faulty areas.

The FTU is a switch monitoring device installed next to the feeder switch, which is generally composed of a main control unit, a battery management unit (responsible for charge and discharge management) and the battery. FTU supports feeder automation function for automatic fault isolation and to reduce the impact of accidents.

United States market for Distribution Automation Terminals (DTU and FTU) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
