District energy, both heating and cooling, tie together the energy generating sources in a city with buildings and facilities having a need of heating and/or cooling. Instead of each building having its own heating or cooling system, the energy is delivered to several buildings in a larger area from a central plant. The water based distribution system guarantees that heat and cooling arrive safely to the end users. With district heating, energy is saved overall, as it takes advantage of resources that would otherwise not be have been used, making it an efficient and sustainable solution to satisfy the local heat and cooling demand in a city.

The global District Heating and Cooling market size is projected to grow from US\$ 258790 million in 2024 to US\$ 469470 million in 2030; it is expected to grow at a CAGR of 10.4% from 2024 to 2030.
