The global Divertor Target Plate market size is predicted to grow from US\$ 33.31 million in 2025 to US\$ 85.45 million in 2032; it is expected to grow at a CAGR of 14.8% from 2026 to 2032.

The divertor target plate is a plasma direct contact component installed in the divertor of the nuclear fusion device. Its main function is to withstand and dissipate the extremely high heat flux and particle bombardment from the plasma, while guiding impurities and helium ash out of the reaction zone, thereby protecting the first wall and vacuum chamber structure. Its typical structure is a composite system of 'tungsten plasma facing material+copper alloy heat sink+internal high-efficiency cooling channel', which is one of the core components determining the operating life and safety of fusion devices. In the next generation of fusion devices, controlling the thermal load of the divertor faces challenges. On the one hand, the polarizer target plate needs to withstand extremely high steady-state thermal loads; On the other hand, in high constraint modes, the plasma boundary will generate a periodic instability called edge localized mode (ELM), and the transient thermal load generated by it may damage the internal components of the device and introduce impurities. Usually, injecting light impurity gas into the off target state of the divertor is used to alleviate its steady-state heat load. However, deep off target often cools the pedestal region at the edge of the plasma, leading to a decrease in performance. The previous implementation of ELM free operation was often accompanied by degradation of platform performance. Therefore, exploring a steady-state operating mode that can simultaneously achieve off target of the polarizer, completely suppress ELM, and maintain high-performance platform is an important goal of international fusion research. In 2025, global Divertor Target Plate production reached approximately 38 Units, with an average global market price of around K US\$ 896 per Unit. The annual production capacity of divertor target plates is 50 units, with a gross profit of about 30%.

Upstream: tungsten and tungsten alloys; copper alloy; Welding and connection materials.

Downstream: nuclear fusion experimental devices (such as ITER EAST, etc.); Integration of biased filter system; Demonstration reactor and future commercial fusion power plant.

The cost of high-performance materials accounts for 40% -50%; Precision manufacturing and connection costs account for 25% -30%; R&D and testing costs account for 15% -20%; Quality control and certification costs account for 5% -10%; Transportation and integration costs account for 3% -5%.
