DNA synthesis is the natural or artificial creation of deoxyribonucleic acid (DNA) molecules. DNA is a macromolecule made up of nucleotide units, which are linked by covalent bonds and hydrogen bonds, in a repeating structure. DNA Synthesis refers to the process of artificially synthesizing DNA molecules under laboratory conditions. DNA synthesis is usually carried out through chemical synthesis methods, using known nucleotide monomers (A, T, C, G) in a specific order to gradually assemble the target DNA sequence in a test tube. DNA synthesis has a wide range of applications in the field of biotechnology, such as gene cloning, gene editing, synthetic biology and other fields. Scientific researchers and biotechnology companies can use DNA synthesis technology to design and synthesize specific DNA sequences for research on gene function, biomedical research and development, bioinformatics, etc. The development of DNA synthesis technology allows scientists to quickly and accurately synthesize DNA sequences of various lengths and complexities, providing powerful tools and support for life science research and biotechnology applications.

The global DNA Synthesis market size is projected to grow from US\$ 1339 million in 2024 to US\$ 3029 million in 2030; it is expected to grow at a CAGR of 14.6% from 2024 to 2030.
