Docosanoic acid is a saturated fatty acid that is derived from the oil extracts of plants and used as a component of conditioning agents. docosanoic acid is also a part of a novel complex of lipophilic ingredients developed for the treatment of dry skin. The properties of docosanoic acid were studied in comparison to others fatty acids and it was found that docosanoic acid does not inhibit the UDP glucuronosyltransferase (UGT) 1A1 enzyme. The high levels of docosanoic acid in patients with low-grade glial tumors is an important indicator of the persistence of tissue integrity and tissue resistance. Therefore, docosanoic acid levels can be a prognostic factor in glial tumors.

As a fatty acid, docosanoic acid is important to help provide a protective barrier against the environment in order to maintain good skin quality. In skincare, docosanoic acid has lubricant, emollient, and soothing properties, which help to restore the skin’s natural oils and improve overall levels of hydration. Furthermore, this sebaceous fatty acid is favorably soluble against the skin’s surface, making it a desirable ingredient to infuse into skincare formulas.
