Doppler ultrasonic diagnostic equipment includes Doppler auscultation type diagnostic equipment, ultrasonic Doppler pulse meter, ultrasonic Doppler blood flow measuring instrument, etc. It is a non-invasive examination method used in obstetrics to examine the fetal heart, Fetal and placental blood circulation; diagnosis of cardiovascular, craniocerebral, hepatobiliary, pancreas, spleen, kidney, eye, abdomen and pelvic masses, serous effusion, breast, thyroid, adrenal and bladder, and peripheral vascular diseases. The principle of the instrument is that the oscillating part of the instrument emits a certain frequency of ultrasonic waves, which are directed to the part to be inspected through the probe. If the interface moves toward the probe, the echo frequency is higher than the emission frequency. When the interface moves away from the probe, the echo frequency decreases. The difference between them is called the difference frequency. The size of the difference frequency is proportional to the speed of the interface. The Doppler signal is detected, analyzed and processed, and then amplified or detected or displayed on the fluorescent screen of an oscilloscope to draw conclusions.
