## Abstracts

The global Double Belt Press (DBP) market size is predicted to grow from US\$ 135 million in 2025 to US\$ 339 million in 2032; it is expected to grow at a CAGR of 14.3% from 2026 to 2032.

A double belt press is an industrial machine that uses two continuously running steel belts to apply controlled temperature, pressure, and speed for continuous hot-pressing, curing, or laminating of materials. Its core feature is the closed pressing zone formed by the dual steel belts, which delivers stable, adjustable, and highly uniform pressure and heat over a long distance. This makes it particularly suitable for producing materials such as composites, wood-based panels, decorative surfaces, battery separators, and photovoltaic encapsulation films. With advantages including continuous processing, excellent uniformity, high productivity, and a customizable process window, the double belt press has become a critical piece of equipment in many advanced material manufacturing lines. In 2024, global double belt press sales reached approximately 30 units, and the prices of products from different manufacturers vary greatly.

The market for double belt presses is primarily driven by the growing demand for continuous, high-quality manufacturing of advanced materials—such as composites, decorative surfaces, battery separators, and photovoltaic encapsulation films—across multiple industries. Expanding production in sectors like new energy, photovoltaics, and high-performance materials is pushing manufacturers to adopt equipment that offers higher automation, better process consistency, and large-scale throughput. In addition, the need for cost-efficient, energy-saving, and more environmentally friendly production processes further supports the adoption of double belt press technology.
