The dual-circuit recirculating ball hydraulic steering gear is a hydraulic power steering system that provides steering assistance through two independent hydraulic circuits. Such systems typically include two hydraulic circuits: one for normal steering operation and another to provide additional power assistance. During normal driving, the system will control the hydraulic flow direction according to the rotation of the steering wheel and provide appropriate power assistance; when turning at low speeds or when greater steering force is required, the additional hydraulic circuit will provide more power assistance, making the driver more efficient. Turn the steering wheel easily. Double-circuit recirculating ball hydraulic steering gear usually has the characteristics of sensitive response, adjustable steering torque, and smooth steering. It is widely used in the steering systems of various vehicles to improve driving comfort and safety.
